After 2 decades of starting, growing and shrinking my franchised enterprise, with a max gross revenue of \$2M, 35 employees & 6 locations, I am looking for a new challenge in the technology sector. I am returning to my high-school objective of working in the software industry.

I have completed an online crash course on frontend software developing. I have undertaken a few projects over the past few months. I invite you to test out [my projects](#).

[Online Library App](#)

As part of my crash course on HTML, CSS, Javascript and React, I created a library app that shows books available for purchase. Available books can be sorted in name, price & rating order. User chooses their book and gets recommendations of 4 highly-rated books which they can add to their cart. If they choose a book already in the cart, they get a choice to go to the cart or choose another book. Once user is finished shopping they get directed to their cart where they see the final itemised cost of their shop. Unfortunately, have not yet worked out the functionality for the checkout. I am sure no-one wants to pay for a fictitious shopping list.

[Netflix Clone App](#)

Using a static data file of limited movies resource, learned from Avinash to create a user authentication dialogue linked to Firestore and upon successful registration / sign in, user gets to browse the database, grouped under a variety of categories, and watch trailers available.

[Spotify Clone App](#)

Learned from Avinash to create a Spotify clone app, using a static database, using TailwindCSS for the first time. Users can sample a limited number of audio files, grouped under a few psuedo albums where they can play/pause/skip back & forth/slide within an audio clip.

[Movies App](#)

Using a live link to the IMDB Movies via API, user get to research some of their favorite movies by searching a keyword, sort the results by name or year of release. By choosing one of the results, they will get detailed information about their chosen movie, such as actors, genre, plot and IMDB rating. I have applied my crash course learnings on HTML, CSS, Javascript & React to this project.
